

IN THE ABSTRACT:

Please amend the abstract as follows:

A cable disengagement prevention configuration for a drum brake device that provides a simple and safe connection of a brake cable to a brake lever and reliably prevents disengagement of the brake cable after connecting the brake cable to the brake lever. The cable disengagement prevention configuration mainly comprises a bowfront portion 48f (18f) of the brake lever 48 (18) and a brake shoe 44 (11). The bowfront portion 48f (18f) is formed between a primary seating 48e (18e) and a secondary seating (18g) and is positioned apart from the primary seating 48e (18e) at an opening side of a U-shaped groove 48d (18d). The cable disengagement prevention configuration allows a cable end fitting 28 (28) to pass through a gap between the brake lever 48 (18) and the brake shoe 44 (11) only when rotating the brake lever 48 (18).
